

# 18.404/6.840 Lecture 7

## **Last time:**

- Equivalence of variants of the Turing machine model
  - a. Multi-tape TMs
  - b. Nondeterministic TMs
  - c. Enumerators
- Church-Turing Thesis
- Notation for encodings and TMs

## **Today:**

- Decision procedures for automata and grammars

Will have mini chat-breaks (experiment)

# TMs and Encodings – review

A TM has 3 possible outcomes for each input :

1. Accept (enter )
2. Reject by halting (enter )
3. Reject by looping (running forever)

is T-recognizable if for some TM .

is T-decidable if for some TM decider .

halts on all inputs

encodes objects as a single string.

Notation for writing a TM is

“On input

[English description of the algorithm]”

# Acceptance Problem for DFAs

Let  $M$  be a DFA and  $x$  be a string

Theorem:  $A_M$  is decidable

Proof: Give TM  $M'$  that decides  $A_M$ .

"On input  $\langle M, x \rangle$ "

1. Check that  $\langle M, x \rangle$  has the form where  $M$  is a DFA and  $x$  is a string; *reject* if not.
2. Simulate the computation of  $M$  on  $x$ .
3. If  $M$  ends in an accept state then *accept*. If not then *reject*."

**Shorthand:**  
On input  $\langle M, x \rangle$

# Acceptance Problem for NFAs

Let  $M$  be a NFA and  $x$  accepts

Theorem:  $A_M$  is decidable

Proof: Give TM  $T_M$  that decides  $A_M$ .

“On input

1. Convert NFA  $M$  to equivalent DFA  $D$ .
2. Run TM  $T_D$  on input  $x$ . [ Recall that  $T_D$  decides  $A_D$  ]
3. *Accept* if  $T_D$  accepts.  
*Reject* if not.”

**New element:** Use conversion construction and previously constructed TM as a subroutine.

# Emptiness Problem for DFAs

Let  $M$  be a DFA and

Theorem:  $L(M) = \emptyset$  is decidable

Proof: Give TM  $T$  that decides  $L(M) = \emptyset$ .

“On input  $\langle M \rangle$  [IDEA: Check for a path from start to accept.]

1. **Mark** start state.
2. Repeat until no new state is marked:  
Mark every state that has an incoming arrow from a previously marked state.
3. *Accept* if no accept state is marked.  
*Reject* if some accept state is marked.”

# Equivalence problem for DFAs

Let  $M_1$  and  $M_2$  be DFAs and

Theorem:  $L(M_1) = L(M_2)$  is decidable

Proof: Give TM  $M$  that decides  $L(M_1) = L(M_2)$ .

## Check-in 7.1

Let  $R_1$  and  $R_2$  be regular expressions and

Can we now conclude that  $L(R_1) = L(R_2)$  is decidable?

- a) Yes, it follows immediately from things we've already shown.
- b) Yes, but it would take significant additional work.
- c) No, intersection is not a regular operation.

# Teach at Splash!

[esp.mit.edu/splash20](https://esp.mit.edu/splash20)

Splash is an annual teaching and learning extravaganza, brought to you by MIT ESP!

**When?** November 14-15

**Where?** Virtual

**What?** Teach anything! Any topic, length, or class size!

**Who?** Teach thousands of curious and motivated high schoolers

# Acceptance Problem for CFGs

Let

**Theorem:** is decidable

**Proof:** Give TM that decides .

“On input

1. Convert into CNF.
2. Try all derivations of length .
3. *Accept* if any generate .  
*Reject* if not.

## Check-in 7.2

Can we conclude that is decidable?

- a) Yes.
- b) No, PDAs may be nondeterministic.
- c) No, PDAs may not halt.

Recall Chomsky Normal Form (CNF) only allows rules:

$A \rightarrow BC$   
 $A \rightarrow b$

**Lemma 1:** Can convert every CFG into CNF.  
Proof and construction in book.

**Lemma 2:** If is in CNF and then every derivation of has steps.  
Proof: exercise.

# Emptiness Problem for CFGs

Let  $G$  is a CFG and

Theorem:  $L(G)$  is decidable

Proof:

“On input  $w$  [IDEA: work backwards from terminals]

1. **Mark** all occurrences of terminals in  $w$ .
2. Repeat until no new variables are marked  
Mark all occurrences of variable  $A$  if  
 $A \rightarrow \alpha$  is a rule and all  $\alpha$  were already marked.
3. *Reject* if the start variable is marked.  
*Accept* if not.”

# Equivalence Problem for CFGs

Let  $G_1$  and  $G_2$  be CFGs and

Theorem:  $L(G_1) = L(G_2)$  is NOT decidable

Proof: Next week.

Let  $G$  be an ambiguous CFG

## Check-in 7.3

Why can't we use the same technique we used to show  $L(G)$  is decidable to show that  $L(G)$  is decidable?

- a) Because CFGs are generators and DFAs are recognizers.
- b) Because CFLs are closed under union.
- c) Because CFLs are not closed under complementation and intersection.

# Acceptance Problem for TMs

Let  $M$  is a TM and  $x$  accepts

Theorem:  $A_M$  is not decidable

Proof: Thursday.

Theorem:  $A_M$  is T-recognizable

Proof: The following TM  $M'$  recognizes

“On input

1. Simulate  $M$  on input  $x$ .
2. *Accept* if  $M$  halts and accepts.
3. *Reject* if  $M$  halts and rejects.
4. ~~Reject if  $M$  never halts.~~ Not a legal TM action.

Turing’s original “Universal Computing Machine”

Von Neumann said inspired the concept of a stored program computer.

# Quick review of today

1. We showed the decidability of various problems about automata and grammars:

, , , , ,

2. We showed that is T-recognizable.
